

# Project Proposal

## *Benz Health App.*

The Benz Health Application is a new way to solve your health problems.

In this application, a user with one or the other health issue gets help, in terms of recognition and consultation. The user is required to enter certain details such as their age, gender, etc. For instance, there is a user that's feeling under the weather or gets an unusual temperature reading, they can enter this into the app and the application can suggest them with firstly, the medicines they may need, mostly prescription free one's and some exercises, etc. Secondly, and the important one, a list of the most probable disease or an infection that a person may have, since she/he has a particular symptom they entered, they will be made aware of. Example, for a user who enters a temperature above 100 degrees Celsius, will be recommended *Acetaminophen* and will be made aware of that it's a symptom of SARS CoV-2(That causes CoVid-19) and will be recommended to get tested for the same. This idea can help billions of people since now they don't have to book an appointment, or call a doctor and hope they'd pick up. Java is the technology that'd be used for most of the part. In Java, a big part will be played by JavaFX, which will help creating UI part of the Software.
